Summary

\textit{Tylophora indica} (Burm. f.) Merr is a medicinal member belongs to the tribe Marsdenieae of the sub-family Asclepiadoideae and family Asclepiadaceae. Traditionally, some medicinal member belongs to the tribe Marsdenieae has been used in treatment of diabetes. The present study explores the anti-diabetic potential of \textit{T. indica} in diabetic Balb/c mices. Qualitative test of gymnemic acid from the stem and leaf of \textit{T. indica} were carried out. Diabetic Balb/c mice were treated with the alcoholic extracts of \textit{T. indica}. Blood glucose level in diabetic Balb/c mices was estimated. The leaf and stem of this plant gave positive test for gymnemic acid. Results indicated that \textit{T. indica} showed hypoglycemic activity. These results suggested that \textit{T. indica} can be used as an anti-diabetic.

Key Words: Anti-diabetic; \textit{Tylophora indica}

Introduction

Diabetes is a consequence of abnormalities in the blood levels of insulin, the hormone that converts blood sugar into energy. Adult-onset diabetes is caused by the body's inability to adequately process of insulin. Today it is known as Type II diabetes, non-insulin-dependent diabetes mellitus (NIDDM) and stable diabetes.
Type I diabetes or juvenile diabetes results from an insulin shortage. Type I diabetes is also called insulin-dependent diabetes mellitus (IDDM). The tribe Marsdenieae of the sub-family Asclepiadoideae and family Asclepiadaceae contains a number of medicinally important genera like Gymnema, Bidaria, Tylophora and Wattakaka. Traditionally, some medicinal member belongs to the tribe Marsdenieae has been used in treatment of diabetes. Thousands of years ago, Type II diabetes was treated with Gymnema sylvestre a medicinal member belongs to the tribe Marsdenieae. In ancient Indian texts, Gymnema is referred to as Gurmar, which means, “sugar killer” in Sanskrit. Antidiabetic effect of a leaf extract from G. sylvestre in non-insulin dependent diabetes mellitus patients, normal and diabetic persons and rat has investigated by various research workers. Notable among these are Warren (15), Yackzan (16,17,18,19). G. sylvestre leaves contain gymnemiacids, which are known to suppress transport of glucose from the intestine into the blood stream (1,2,8,11,12), therefore, it is useful in lowering blood sugar, lowering blood cholesterol levels, balancing insulin levels and also for promoting weight loss. Recently, hypoglycemic potential of Bidaria khandalense (Sant.) Jagtap and Singh in diabetic Balb/c mice has investigated and results indicated that B. kandalense showed hypoglycemic activity like that of G. sylvestre (11). Tylophora indica (Burm. F.) Merr. (= T. asthamatica Weight) is a medicinal member belongs to the tribe Marsdenieae. T. indica has recently been included as one of the important drug from natural source for the treatment of respiratory diseases. Traditionally, Tylophora indica has been used in treatment of asthma, dermatitis and rheumatism. According to Chopra et al. (5), the powdered leaves, stem and root contain 0.2 - 0.3 per cent (up to 0.42-0.46 %) of alkaloids. Tylophorine and tylophorinine are important alkaloids encountered and the percentage is not affected by seasonal variations (6). The effect of the alcoholic extract of Tylophora indica on weight of the adrenal glands and its functional activities and pituitary adrenal axis was studied on normal, unilaterally adrenalectomised, dexamethasone treated and hypophysectomised male albino rats. The extracts showed stimulation of adrenals as indicated by increase in weight and decrease in cholesterol and vitamin C. The plasma steroid level was increased but skin hydroxyproline level findings were not conclusive. From this result it may be concluded that Tylophora indica acts as direct stimulation of adrenal cortex (14). However, no literature is available on its chemical constituents and anti-diabetic potential of this plant. Thus, we selected Tylophora indica of the tribe Marsdenieae to evaluate for its anti-diabetic action in diabetic Balb/c mice.
Materials and Methods

a) Material: Streptozotocin and Dimethy sulfoxide (DMSO) were obtained from Sigma chemicals and Accu-chek blood glucose analyzer was a product of Roche. The plant specimens were collected from various places of Maharashtra State (India) such as Ambaghat, Amboli, Mahabaleshwar and Dapoli. Efforts were made to collect the plants when they started flowering and fruiting for the correct botanical identification. The plant material was brought to the laboratory and identified with the help of flora of Maharashtra State (13), Fasicals of flora of India (9) and Flora of British India (8).

b) Animals: The Experimental Animal Facility at the National Centre for Cell Science, India provided all the animals. Male Balb/c mice 6-8 weeks old were made diabetic by intraperitoneal injection of streptozotocin (180 mg/kg body weight) freshly dissolved in chilled sodium citrate buffer (pH 4.5). Mice showing blood glucose above 200 mg/dL were taken for further experiments. They were kept under 12h in light and 12h in dark conditions at 25°C and fed them with ad libitum during the experiment (4).

c) Phytochemical screening: In the present investigation qualitative test of gymnemic acid from the stem and leaf of *T. indica* were carried out (12).

c - 1) Qualitative test of Gymnemic acid:

Procedure:

Sample Preparation: Take 1 gm of stem or leaf powder of plant samples of each studied material and mixed in 5 ml methanol (Conc. 200mm or 200µg/µl), Sonicate the mixture, filter the extract and filtrate was used for application.

Stationary Phase: Percolate Silica Gel TLC Plate (20x10cm Mere No. 5554).

Mobile Phase : N butanol : Methanol : Water.

\[
\begin{align*}
3 & : 1 & : 1 \\
\end{align*}
\]

Developing distance : 80mm.
Tan Saturation : 10 min.
Scanning Wavelength : 580 nm.
Spraying reagent : raniline sulphuric acid.
Rf : 0.61.
Standard gymnemic acid : 1 µg/µl = 5 µl i.e 1%

d) Test for hypoglycemic potential: Diabetic Balb/c mice were randomly divided into 6 groups (each having 5 animals) to examine the glucose-lowering property of T. indica. All extracts were administered orally at a dose of 50 mg/kg body weight. An effect of vehicle administration DMSO was also determined by acute oral gavage. Blood was collected from tail vein immediately prior to and 24h after administration of the extracts for blood glucose analysis by Accu-chek blood glucose analyzer from Roche (3).

Results

Phytochemical screening: Results on High Performance Thin Layer chromatography (HPTLC) indicated that the leaf and stem of T. indica gave positive test for gymnemic acid.

Hypoglycemic study: Results indicated that T. indica showed hypoglycemic activity (Table No.1). The hypoglycemic activity is first time reported in T. indica and this can be used as a substitute an anti-diabetic to G. sylvestre. These results suggested that T. indica can be used as an anti-diabetic. Thus, the results of this investigation will be helpful for alternative sources of medicine in Ayurvedic, Homeopathic, Unani, Allopathic systems of medicine and Pharmaceutical industries.
