Summary

In vitro antioxidant activity of whole plant of Teramnus labialis (Linn.) extracts obtained by methanolic solvent was evaluated by three different in vitro methods. DPPH (2, 2-diphenyl -1- picryl hydrazyl) method, superoxide anion scavenging and iron chelating activity. The DPPH radical scavenging activity of Methanolic extract (IC_{50} = 210 \mu g/ml) was better than that of standard Rutin (IC_{50} = 480 \mu g/ml), The superoxide anion scavenging activity of methanolic extract (IC_{50} = 70 \mu g/ml) was better when compared the standard Quercetin(IC_{50} = 60\mu g/ml), and iron chelating activity of methanolic extract (IC_{50} = 160\mu g/ml) was superior to standard EDTA (IC_{50} = 65\mu g/ml). The above result of possess good production against oxidative damage an antioxidant activity when compare to the above all standard.

Keywords: Antioxidant, Teramnus labialis (Linn.), DPPH method, Superoxide anion scavenging activity, Iron chelating activity.

Introduction

Plant derived natural chemicals, known as secondary metabolites, are effective in their roles of protection, adaptation and pollination. Secondary metabolites are mainly used in food, pharmaceutical, chemical, cosmetic industries and agriculture [1-2].
Oxidative stress induced ROS and free radicals are believed to be major cause of physiological disorders like alzhemers, Parkinsons, arthritis, atherosclerosis, coronary heart diseases, Emphysema, gastric ulcer, diabetics mellitus, cirrhosis, aging and cancer [3-4]. epidemiological and in vitro studies on medicinal plants and vegetables strongly have supported the idea that plant constituents with antioxidant activity are capable of exerting protective effects against oxidative stress in biological system[5-7].

Teramnus labialis (L) spreng (Family; Fabaceae) is a herb, commonly known as mashaparni and a well known medicinal plant in the Ayurvedic system of medicine. It has been reported to be useful in treating rheumatism, tuberculosis, nerve disorders, paralysis and catarrhs [8-10], and chemical analysis and nutritional assessment [11]. the plant used as antihyperglycemic activity [12], anti-inflammatory activities [13], a noval bioactive flavonol glycoside from teramnus labialis [14]. Therefore, the present investigation was to evaluate the free radical scavenging activity of methanolic extract of whole plant of teramnus labialis with three invtro antioxidant methods.

Material and Methods

Collection and Identification of Plant materials

The Whole plant of Teramnus labialis, were collected from Kilikulam, Tirunelveli District of Tamil Nadu, India. Taxonomic identification was made from Botanical Survey of Medicinal Plants Unit Siddha, Government of India. Palayamkottai, Tamilnadu. The whole plant of teramnus labialis (Linn), were dried under shade, segregated, pulverized by a mechanical grinder and passed through a 40 mesh sieve.

Preparation of Extracts

The above powdered materials were successively extracted with methanol by hot continuous percolation method in Soxhlet apparatus [15] for 24 hrs. The extract was concentrated by using a rotary evaporator and subjected to freeze drying in a lyophilizer till dry powder was obtained.

Evaluation of Antioxidant activity by in vitro Techniques:

DPPH photometric assay [16]

The effect of extract on DPPH radical was assayed using the method of Mensor et al (2001)[16.]. A methanolic solution of 0.5ml of DPPH (0.4mM) was added to 1 ml of the different concentrations of plant extract and allowed to react at room temperature for 30 minutes. Methanol served as the blank and DPPH in methanol without the extracts served as the positive control. After 30 min, the absorbance was measured at 518 nm and converted into percentage radical scavenging activity as follows.

\[
\text{Scavenging activity} \% = \left( \frac{A_{\text{control}} - A_{\text{sample}}}{A_{\text{control}}} \right) \times 100
\]

Where \( A_{\text{control}} \) is the absorbance of DPPH radical+ methanol; \( A_{\text{sample}} \) is the absorbance of DPPH radical+ sample extract/ standard.
Superoxide radical scavenging activity [17]

Superoxide radical (O$_2^-$) was generated from the photoreduction of riboflavin and was deducted by nitro blue tetrazolium dye (NBT) reduction method. Measurement of superoxide anion scavenging activity was performed based on the method described by Winterbourne et al (1975)[17]. The assay mixture contained sample with 0.1 ml of Nitro blue tetrazolium (1.5 mM NBT) solution, 0.2 ml of EDTA (0.1M EDTA), 0.05 ml riboflavin (0.12 mM) and 2.55 ml of phosphate buffer (0.067 M phosphate buffer). The control tubes were also set up where in DMSO was added instead of sample. The reaction mixture was illuminated for 30 min and the absorbance at 560 nm was measured against the control samples. Ascorbate was used as the reference compound. All the tests were performed in triplicate and the results averaged. The percentage inhibition was calculated by comparing the results of control and test samples.

Iron chelating activity [18]

The method of Benzie and strain (1996) [18] was adopted for the assay. The principle is based on the formation of O-Phenanthroline-Fe$^{2+}$ complex and its disruption in the presence of chelating agents. The reaction mixture containing 1 ml of 0.05% O-Phenanthroline in methanol, 2 ml ferric chloride (200µM) and 2 ml of various concentrations ranging from 10 to 1000µg was incubated at room temperature for 10 min and the absorbance of the same was measured at 510 nm. EDTA was used as a classical metal chelator. The experiment was performed in triplicates.

Result and Discussion

1. Dpph Method

DPPH is a stable free radical at room temperature and accepts an electron or hydrogen radical to become a stable diamagnetic molecule[19]. The methanolic extract of *Teramnus labialis* exhibited a maximum DPPH scavenging activity of 67.50% at 1000 µg/ml whereas for Rutin (standard) was found to be 69.83% at 1000 µg/ml. The IC$_{50}$ of the methanol extract of *Teramnus labialis* was found to be 210 µg/ml and Rutin(standard) was found to be 480µg/ml. The percentage of DPPH radical scavenging activity of methanolic extract of *Teramnus labialis* presented in Table 1.

II. SUPER OXIDE METHOD

Superoxide is a highly reactive molecule that reacts with various substances produced through metabolic processes. Superoxide dismutase enzymes present in aerobic
and anaerobic organisms catalyses the breakdown of superoxide radical[20]. The methanolic extract of *Teramnus labialis* exhibited a maximum Superoxide anion scavenging activity of 85.71% at 1000 µg/ml whereas for Quercetin (standard) was found to be 98.01% at 1000 µg/ml. The IC$_{50}$ of the methanolic extract of *Teramnus labialis* was found to be 70µg/ml and Quercetin (standard) was found to be 60µg/ml. The percentage of Superoxide anion scavenging activity of methanolic extract of *Teramnus labialis* presented in Table 2.

**III. IRON CHELATING METHOD**

Iron is essential for life because it is required for oxygen transport, respiration and activity of many enzyme. However, iron is an extremely reactive metal and catalyzes oxidative changes in lipids, proteins and other cellular components[21]. The methanolic extract of *Teramnus labialis* exhibited a maximum iron chelating activity of 94.23% at 1000 µg/ml whereas for EDTA (standard) was found to be 97.90% at 1000 µg/ml. The IC$_{50}$ of the methanolic extract of *Teramnus labialis* was found to be 160µg/ml and EDTA(standard) was found to be 65µg/ml. The percentage of iron chelating activity of methanolic extract of *Teramnus labialis* presented in Table 3.

*All values are expressed as mean ± SEM for three determinations*
The results of the above investigation indicated that the methanolic extract of whole plant of *Teramnus labialis* showed significant antioxidant activity was found in DPPH method, superoxide anion scavenging activity and Iron chelating method when compared to the reference standard Rutin, Quercetin and EDTA respectively.

**Conclusion**

The results of the present study was clearly indicated that the methanolic extract of whole plant of *Teramnus labialis* showed significant natural antioxidant activity and used as food supplement in pharmaceutical industry. Phytochemical screening of extract showed presence of Triterpenoids , flavonoids, glycosides, tannins and alkaloids. Hence it can be concluded that these components might be helpful in preventing the progress of various oxidative stress.. Therefore, it is suggested that further work should be performed on the isolation and identification of the antioxidant compounds in *Teramnus labialis*
